Python Basics Cheat Sheet

Quick reference (sample)

1. Variables and types

```
name = "Asha"      # str
age = 18           # int
height = 1.62      # float
is_student = True  # bool
```

2. Printing and f-strings

```
print(f"{name} is {age} years old")
```

3. Lists and dictionaries

```
marks = [78, 91, 66]
marks.append(84)
print(len(marks), max(marks))

student = {"name": "Asha", "branch": "CSE"}
print(student["branch"])
```

4. Loops and conditions

```
for m in marks:
    if m >= 80:
        print(m, "distinction")
    else:
        print(m, "pass")
```

5. Functions

```
def average(values):
    return sum(values) / len(values)

print(average([78, 91, 66]))
```

6. Reading input

```
n = int(input("Enter a number: "))
print(n * 2)
```

Tip: input() always returns text, so convert it with int() or float() before doing maths.
